## lab8 - 高级超时

在实验8中,我学习了如何为Function设置超时。在OpenFaaS中,可以通过"四种类型的总数"环境变量来控制超时时间。

- sleep\_duration
- read\_timeout
- write\_timout
- exec\_timeout

API Gateway 的默认超时20s,测试如下:

## sleep\_duration: 10

```
$ faas-cli new --lang python3 sleep-for --prefix="gogobody"
$ nano sleep-for/handler.py
$ nano sleep-for.yml
add this:
    environment:
        sleep_duration: 10
        read_timeout: "5s"
        write_timeout: "5s"
        exec_timeout: "5s"
$ faas-cli.exe build -f sleep-for.yml
$ faas-cli.exe deploy -f sleep-for.yml
```

```
Administrator@Javascript MINGW64 /e/faas/lab8 (master)
$ echo | faas-cli invoke sleep-for
Server returned unexpected status code: 502 -
```

超时返回502,测试成功。

## sleep\_duration: 2

```
$ nano sleep-for.yml
change this:
    environment:
       sleep_duration: 2
$ faas-cli.exe build -f sleep-for.yml
$ faas-cli.exe deploy -f sleep-for.yml
```

```
Administrator@Javascript MINGW64 /e/faas/lab8 (master)
$ echo | faas-cli invoke sleep-for
Starting to sleep for 2
Finished the sleep
```

2s没有超时,成功执行了function。
